

Spatiotemporal patterns, triggers and anatomies of seismically detected rockfalls

Supplementary material

Authors: Michael Dietze, Jens M. Turowski, Kristen L. Cook, Niels Hovius (GFZ Potsdam, Section 5.1 Geomorphology)

Citation: Dietze, M., Turowski, J. M., Cook, K. L., and Hovius, N.: Spatiotemporal patterns and triggers of seismically detected rockfalls, Earth Surf. Dynam. Discuss., <https://doi.org/10.5194/esurf-2017-20>, in review, 2017.

Introduction

This supplementary material contains a documentation of all 49 detected rockfall events from the main article. The methods of data processing are explained in this main article. The supplementary material contains for all rockfall events the full set of timing, seismic processing setup and results as well as results of the trigger mechanism analysis.

For the rockfall depicted in figure 3 of the article this material contains the R code used to generate the location estimates as well as plots of the signal envelopes for each of the located pulses.

Furthermore, for all events with a preceding and posterior time window of in total about 15 minutes, power spectral density estimates (PSD) were plotted. The PSDs were calculated from the vertical component of the most representative seismic station (denoted in the title), with signals deconvolved and filtered between 1 and 80 Hz. The PSDs are overlain by the waveform of the seismic data (semi transparent white line) and the onset of the rockfall event is indicated by a black square at the bottom of the figure. All data were processed with the R-package ``eseis'' version 0.3.1.

The raw seismic data (vertical components of all available stations) is provided as ASCII files with a buffer of 60 s before and 120 s after the raw picked event. The time stamp is given as POSIXct string. The files ``seismic stations 2014.txt'' and ``seismic stations 2015.txt'' contain information about station IDs, locations in UTM coordinates and sensor and logger types.

2 Tables

Table 1: Data table part 1. Rockfall event definitions, seismic STL-LTA-picking setup and localisation setup and metadata. ID is consecutive in time and links to 3 and the main article. Event start denotes rockfall initiation as detected from seismic data, given in UTC time. Duration_{picked} is the event duration based on the STA-LTA-picking routine (cf. main article). Duration_{manual} is the duration of a rockfall event from manual inspection of the seismic data. Variables f_{low} and f_{high} denote the filter frequency limits for localisation. Variables t_{pre} and t_{post} indicate additional time added to Event start and Duration_{manual} for localisation to cover variability of all included signals. SNR_{station} is the signal-to-noise ratio threshold that needed to be passed to allow localisation of an event. SNR₁ to SNR₄ are the resulting signal-to-noise ratios of the prepared data for localisation. SNR_{mean} is the corresponding average signal-to-noise ratio.

ID	Event start	Duration _{picked} (s)	Duration _{manual} (s)	f _{low} (Hz)	f _{high} (Hz)	t _{pre} (s)	t _{post} (s)	SNR _{station}	SNR ₁	SNR ₂	SNR ₃	SNR ₄	SNR _{mean}

Table 2: Data table part 2. Rockfall event localisation results, rockfall-associated seismic signals and trigger characteristics. ID corresponds to 1. X_{seis} , Y_{seis} and Z_{seis} are the cartesian coordinates of the pixel with the highest seismic source location probability density P_{max} . Z_{tls} (m asl.) and V_{tls} (m^3) are the rockfall detachment height and volume based on the lidar study by Dietze et al. (2017). Type denotes rockfall evolutionary type (cf. main article). Event_{pre} and Event_{post} indicate the time lag to previous and posteriour seismic signals that could be attributed to rockfall activity. Location is a descriptive classification of the impact area of the rockmass based on the location estimates and fall times. P_{cum} is the cumulative precipitation amount prior to a rockfall event. Lag_P (h) is the time lag between a rainfall event and a subsequent rockfall. Lag_{FT} (h) is the time lag between a freeze-thaw or thaw-freeze event and the subsequent rockfall. Lag_{quake} (h) is the time lag between a picked earthquake and a subsequent rockfall. Note that for the latter only data from 2015 was screened.

Table 3: Data table part 3. Additional information from descriptive seismic analysis. IDs correspond to previous two tables.

ID	Comment
1	no other signals visible
2	helicopter passing by during event and 10 to 7 minutes before
3	small earthquake about 7 minutes before
4	rain drop impacts throughout all stations
5	rain drop impacts throughout all stations, helicopter passing by 35 minutes before
6	rain drop impacts predominantly at upper stations
7	helicopter passing by 10 to 3 minutes before, unknown source about 2 minutes before event, more prominent at Gate of China
8	explosion preceding event by 6 minutes
9	train passage about 5 minutes before and 1 minute after event
10	train passage about 12 minutes before and one minute after event
11	no other signals visible
12	slight rain event 10 to 5 minutes before
13	no other signals visible
14	helicopter passing by a few minutes before and after the event
15	no other signals visible
16	unidentifiable broadband (10 to 80 Hz) signal pulses before and after the event
17	no other signals visible
18	two weak signals (20-80 Hz) visible some minutes before event
19	train passage about 6 minutes before and 2 minutes after event
20	helicopter passing by about 10 to 5 minutes before event
21	rain noise about 4 minutes before event
22	no other signals visible
23	High frequent (30-80 Hz) short pulse (only visible at that closest station) about 2 minutes before event
24	Preceding rockfall (ID 23) visible 5 minutes before
25	rain drop impacts throughout all stations
26	Weak 10-80 Hz signal period about 4 minutes before event
27	Air-traveled signal about three minutes before event
28	Significant blasting signals 15 to 3 minutes before event
29	rain drop impacts throughout all stations
30	Earthquake about 3 minutes before
31	Train passage about 5 minutes before, remobilisation of debris 2 minutes after rockfall (only visible at Funny Rain)
32	no other signals visible
33	only minor local short pulses of energy visible
34	no other signals visible
35	rockfall outside monitored area about 20 minutes before
36	helicopter passed 10 minutes before, raindrop impacts all the time, constant signal around 40 Hz 6-1 minutes before
37	helicopter passage about 10 minutes before, low frequent activity at Funny Rain one minute before
38	rain drop impacts at all cliff top stations
39	rain drop impacts at all cliff top stations
40	rain drop impacts at all cliff top stations
41	rain drop impacts at all cliff top stations, increasing signal content around 5 Hz
42	abundant avalanche-like signals also before but only visible at Funny Rain
43	short pulses about 20 s before, only visible at Sweaty Herbs and Gate of China
44	no other signals visible
45	helicopter passage about 8 minutes before
46	helicopter passage 5 minutes before and after event
47	low frequent pulse about 30 s before
48	multiple pulses of anthropogenic origin, rockfall is short pulse with sharp onset
49	no other signals visible

Case event II characterisation

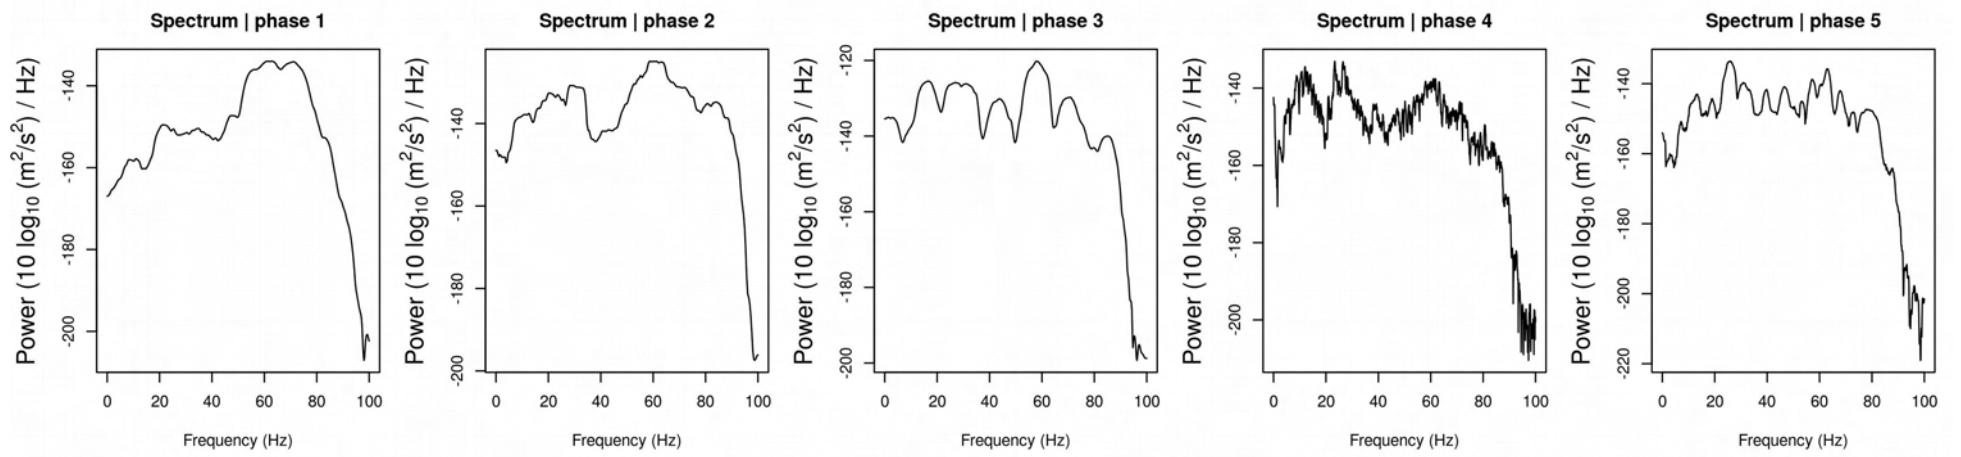

Figure 1. Spectra for the five recorded seismic pulses of the rockfall case event II (figure 3 from the main article) as recorded by station “Basejumpers Mess”.

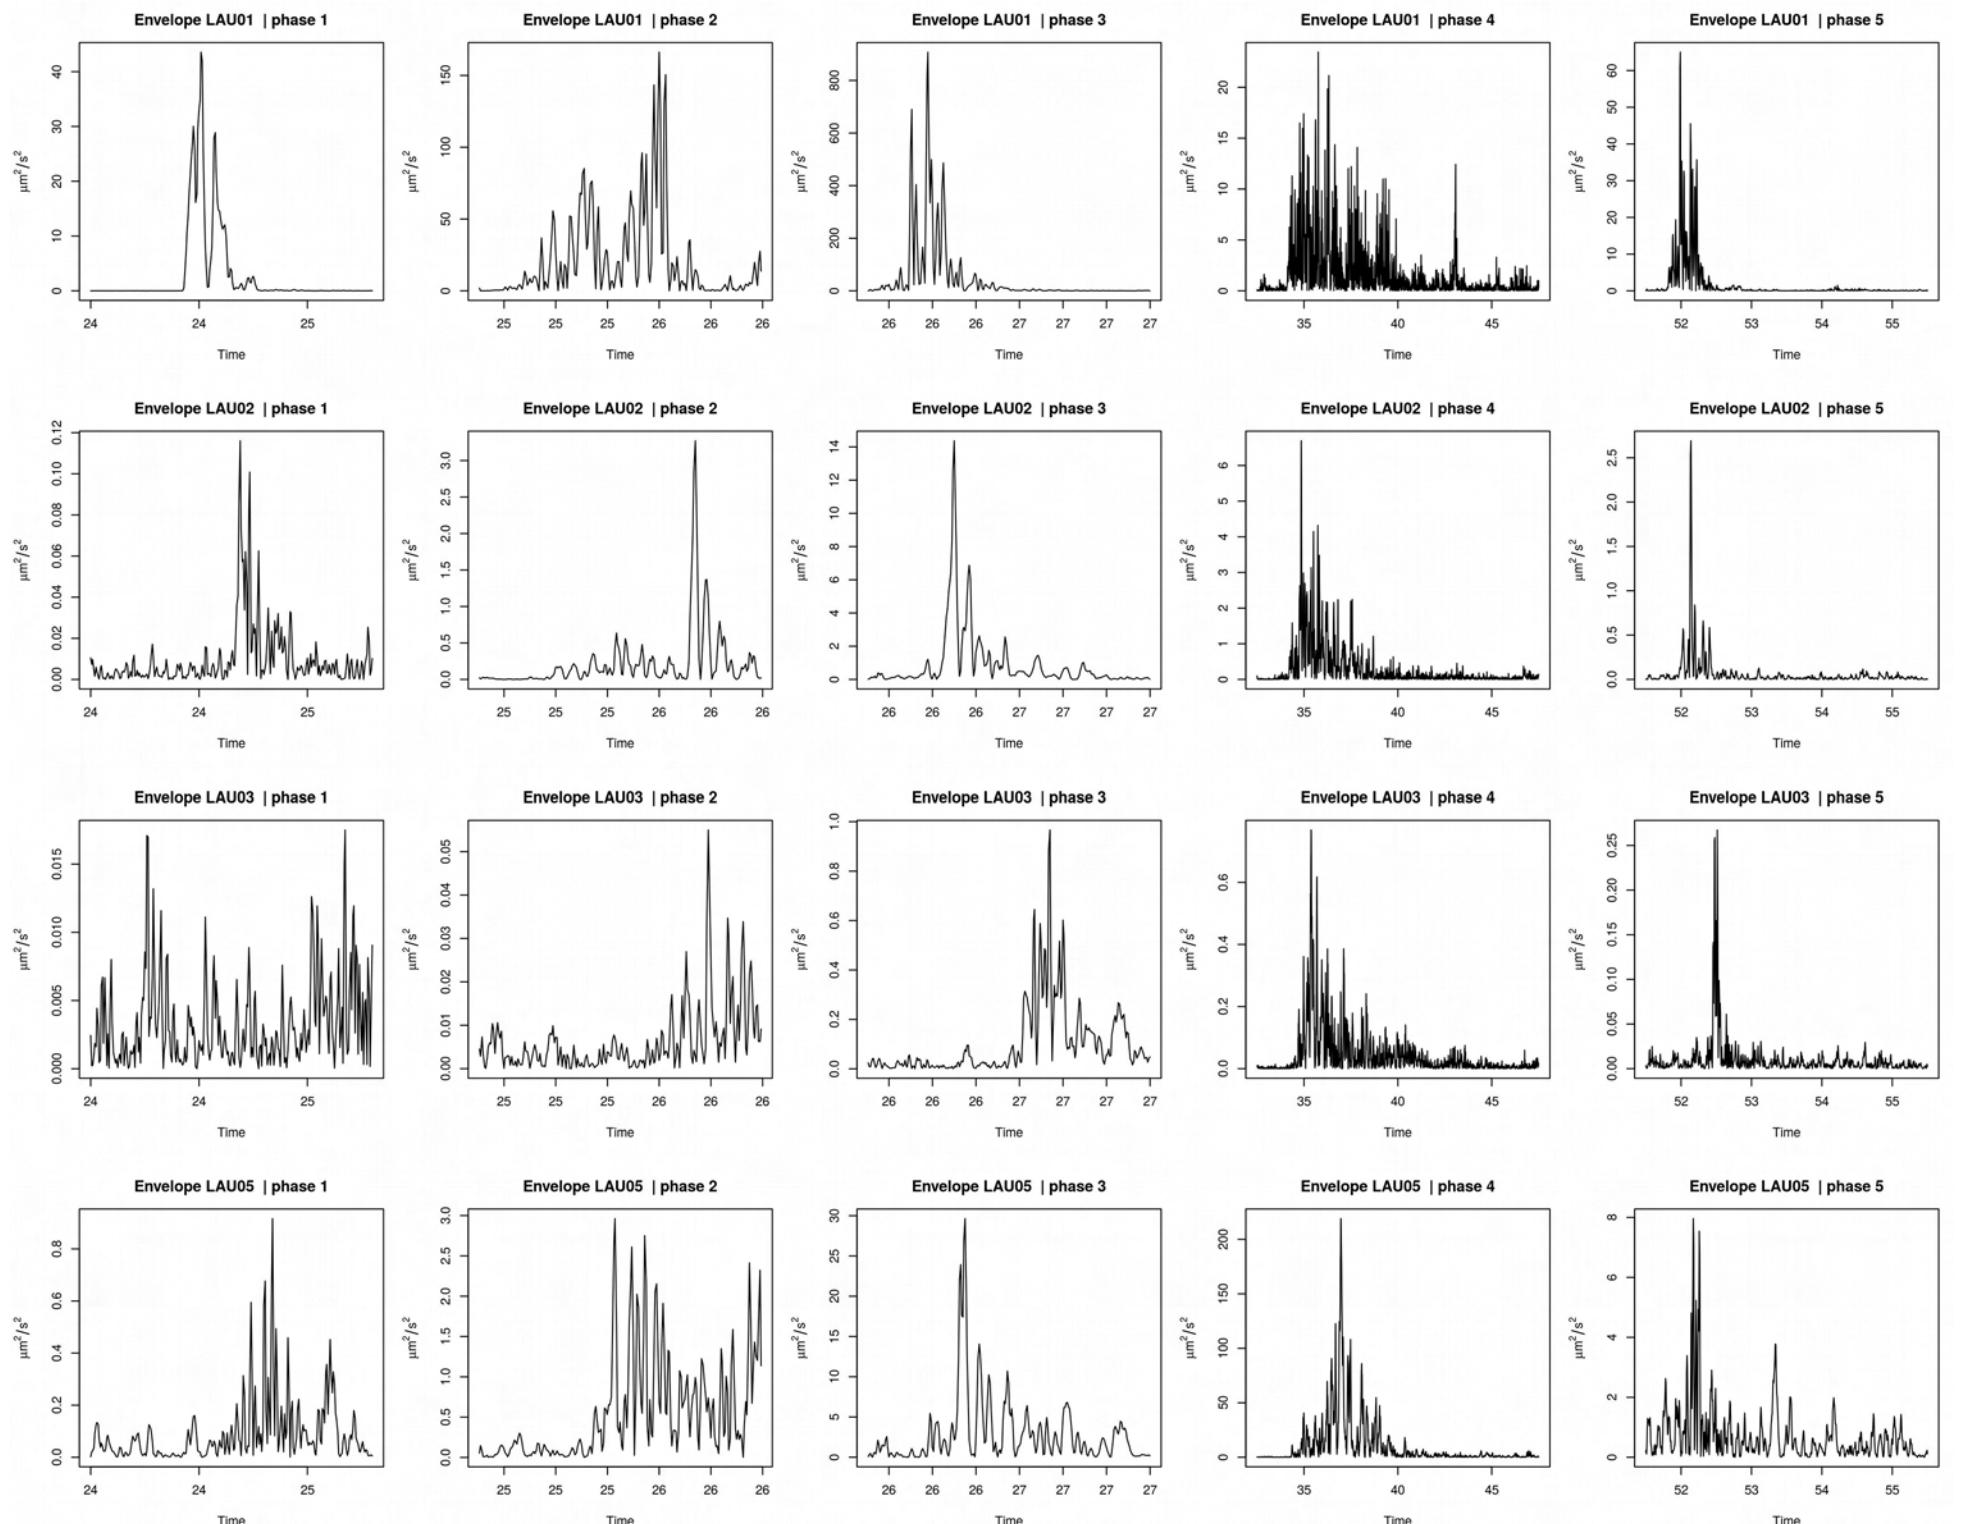

Figure 2. Envelopes of the five recorded seismic pulses of the rockfall case event II (figure 3 from the main article) as recorded by each of the four seismic stations: LAU01 – Basejumpers Mess, LAU02 – Gate of China, LAU03 – Sweaty Herbs, LAU05 Funny Rain.
